Fitting a von Bertalanffy Growth Function

Derek H. Ogle, Northland College

20-Aug-2016

Preliminaries

```
> library(FSAdata)          # for TroutBR data
> library(FSA)              # for filterD(), headtail(), col2rgbt(), vbFuns(), vbStart()
> library(nlstools)         # for nlsBoot()
```

Loading the Data and Some Preparations

```
> data(TroutBR)
> str(TroutBR)
'data.frame':   851 obs. of  3 variables:
 $ tl     : int  16 16 17 17 17 17 17 17 17 17 ...
 $ age    : int  4 4 2 3 3 3 3 3 3 4 ...
 $ species: Factor w/ 2 levels "Brown","Rainbow": 1 1 1 1 1 1 1 1 1 1 ...
```

```
> rbt <- filterD(TroutBR,species=="Rainbow")
> headtail(rbt)
    tl age species
1   12   3 Rainbow
2   14   3 Rainbow
3   14   3 Rainbow
625 31   7 Rainbow
626 31   9 Rainbow
627 32   7 Rainbow
```

```
> xlbl <- "Age (yrs)"
> ylbl <- "Total Length (in)"
> clr <- col2rgbt("black",0.05)
```

Fit Typical VBGF

Declare a Function

```
> vb <- vbFuns("Typical",msg=TRUE)
You have chosen the 'Typical', 'Traditional', or 'BevertonHolt' parameterization.

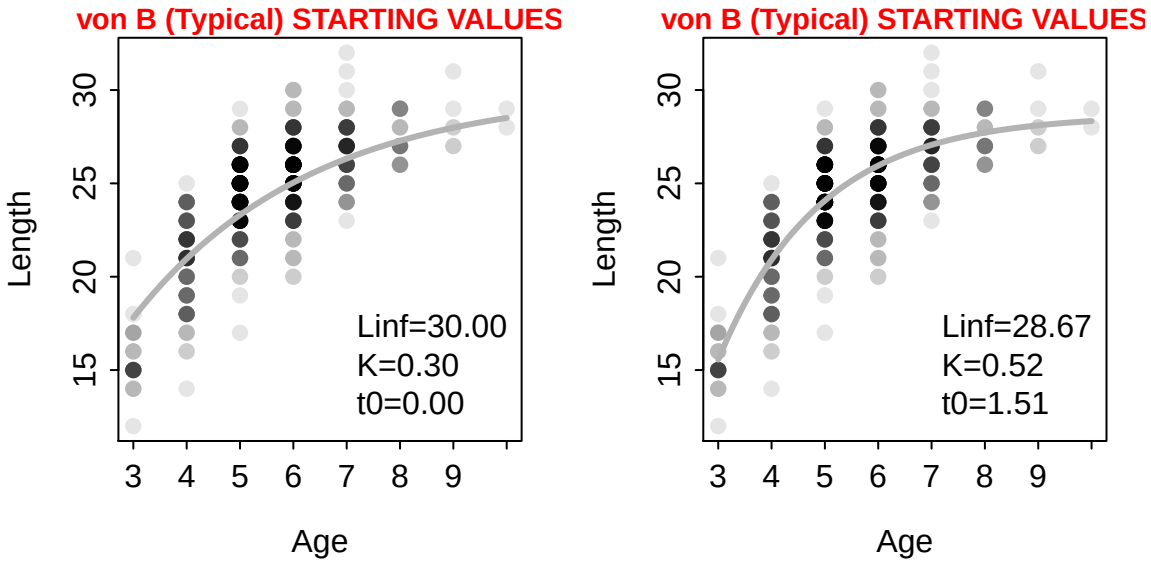
  E[L|t] = Linf*(1-exp(-K*(t-t0)))

  where Linf = asymptotic mean length
          K = exponential rate of approach to Linf
         t0 = the theoretical age when length = 0 (a modeling artifact)
```

```
> vb
function(t,Linf,K=NULL,t0=NULL) {
  if (length(Linf)==3) { K <- Linf[[2]]
                         t0 <- Linf[[3]]
                         Linf <- Linf[[1]] }
  Linf*(1-exp(-K*(t-t0)))
}
<environment: 0x046db6b8>
```

Find Starting Values

```
> # Demos manual generation with plot ... LEFT plot
> svb <- vbStarts(tl~age,data=rbt,type="Typical",plot=TRUE,
                  fixed=list(Linf=30,K=0.3,t0=0))
> # Demos automatic generation ... RIGHT plot
> svb <- vbStarts(tl~age,data=rbt,type="Typical",plot=TRUE)
```



Fit the Model

```
> fit1 <- nls(tl~vb(age,Linf,K,t0),data=rbt,start=svb)
> summary(fit1,correlation=TRUE)

Formula: tl ~ vb(age, Linf, K, t0)

Parameters:
     Estimate Std. Error t value Pr(>|t|)
Linf 27.71191    0.28383   97.64   <2e-16
K     0.63242    0.04248   14.89   <2e-16
t0    1.71686    0.10159   16.90   <2e-16

Residual standard error: 1.775 on 624 degrees of freedom

Correlation of Parameter Estimates:
   Linf  K
K  -0.91
t0 -0.71  0.92
```

```
Number of iterations to convergence: 3
Achieved convergence tolerance: 9.57e-06
```

```
> ( cf <- coef(fit1) )
      Linf          K         t0
27.7119083  0.6324231  1.7168636
```

```
> confint(fit1)
           2.5%      97.5%
Linf 27.1916077 28.3279785
K     0.5499956  0.7192266
t0    1.4930214  1.8999245
```

```
> boot1 <- nlsBoot(fit1,niter=1000)
> str(boot1)
List of 4
 $ coefboot: num [1:1000, 1:3] 27.4 27.7 28.2 27.3 28.1 ...
  ..- attr(*, "dimnames")=List of 2
  .. ..$ : NULL

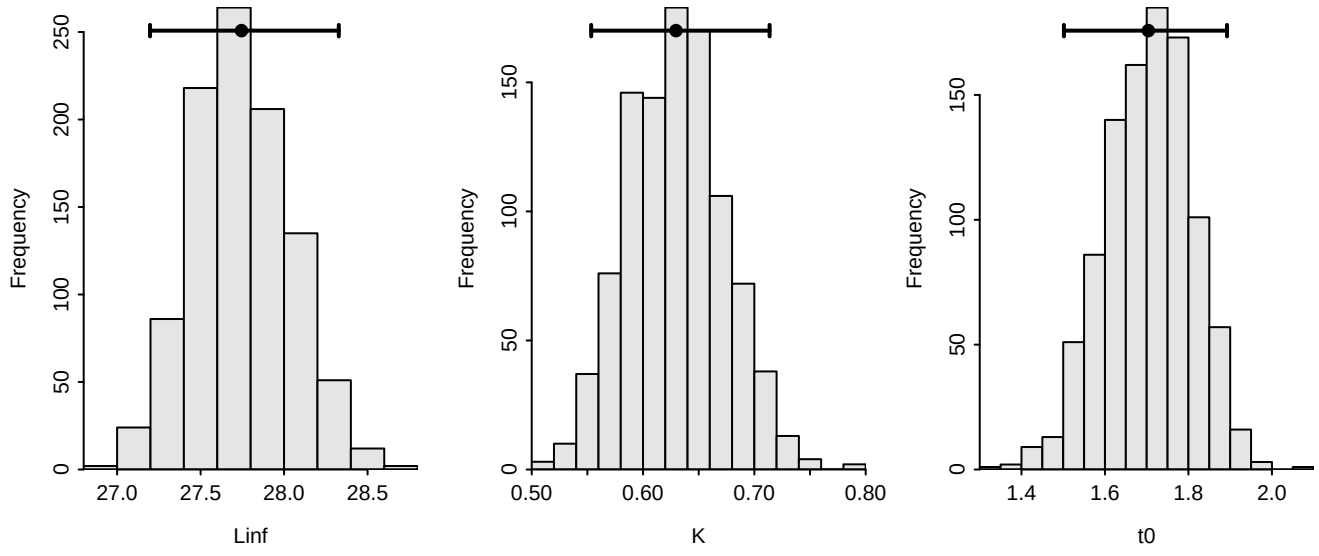
  .. ..$ : chr [1:3] "Median" "2.5%" "97.5%"
 $ estiboot: num [1:3, 1:2] 27.7451 0.6296 1.704 0.2927 0.0433 ...
  ..- attr(*, "dimnames")=List of 2
  .. ..$ : chr [1:3] "Linf" "K" "t0"
  .. ..$ : chr [1:2] "Estimate" "Std. error"
 - attr(*, "class")= chr "nlsBoot"
```

```
> headtail(boot1$coefboot)
            Linf         K       t0
[1,]    27.39122 0.6814322 1.759839
[2,]    27.71790 0.6334392 1.696191
[3,]    28.17703 0.5682013 1.561103
 [998,] 27.75064 0.6110276 1.601623
 [999,] 27.56120 0.6429214 1.687443
[1000,] 27.95883 0.6193504 1.697934
```

```
> confint(boot1,plot=TRUE,rows=1,cols=3)
        95% LCI    95% UCI
Linf 27.1972268 28.3277116
K     0.5534275  0.7137074
t0    1.5016869  1.8924233
```



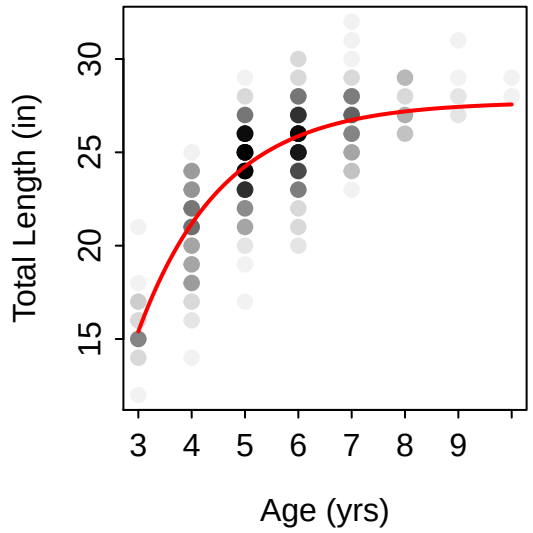
Make Predictions

```
> ageX <- 8
> predict(fit1,data.frame(age=ageX))
[1] 27.19077
```

```
> pv <- apply(boot1$coefboot,MARGIN=1,FUN=vb,t=ageX)
> quantile(pv,c(0.025,0.975))
    2.5%    97.5%
26.85786 27.55556
```

Visualize the Fit

```
> plot(tl~age,data=rbt,xlab=xlbl,ylab=ylbl,pch=19,col=clr)
> curve(vb(x,cf),from=3,to=10,n=500,lwd=2,col="red",add=TRUE)
```



```
> residPlot(fit1)
```
